Vorwort.

Das Jahrbuch für 1891 enthält die vollständigen Beobachtungen für dieselben 12 Stationen, wie der vorhergehende Jahrgang, und die Uebersichtstabellen für 89 Stationen; von letzteren sind 40 solche, die mit Quecksilberbarometern versehen sind, 8 Stationen mit Psychometern, 6 Leuchtfeuerstationen, und 35 Regenmesserstationen.

Im Sommer 1892 unternahm ich eine Inspectionsreise nach den Stationen in Thellemarken, in den Fjordgegenden in Bergens Stift und im Valdersthale. Als Reise-Control-Barometer diente das Barometer Fuess No. 270, welches kurz vorher in Berlin zur Reparatur gewesen war. Eine Reihe Vergleichungen mit den Normalbarometern des Instituts gab vor der Reise

1892. Juni 29.—Juli 17., 13 Vergleichungen, im Mittel

$$\begin{array}{ll} \text{Normal Fuess No. 214} & + 0.12 \text{ mm.} = 753.813 \text{ mm.} \\ \text{, Negretti & Zambra No. 640} & + 0.60 \text{ mm.} = 753.796 \text{ mm.} \end{array}$$

$$\text{Mittel} = 753.805 \text{ mm.}; \text{Diff.} = + 0.017 \text{ mm.}$$

$$\begin{array}{ll} \text{Reisebarometer Fuess No. 270} & \\ \text{,} & = 753.740 \text{ mm.} \end{array}$$

$$\text{Corr.} = + 0.065 \text{ mm.}; \text{M.F.} = \pm 0.027 \text{ mm.}$$

Nach der Reise wurde gefunden:

1892. September 1.—9., 21 Vergleichungen, im Mittel

$$\begin{array}{ll} \text{Normal Fuess No. 214} & + 0.12 \text{ mm.} = 753.817 \text{ mm.} \\ \text{, Negretti & Zambra No. 640} & + 0.60 \text{ mm.} = 753.808 \text{ mm.} \end{array}$$

$$\text{Mittel} = 753.812 \text{ mm.}; \text{Diff.} = + 0.009 \text{ mm.}$$

$$\begin{array}{ll} \text{Reisebarometer Fuess No. 270} & \\ \text{,} & = 753.697 \text{ mm.} \end{array}$$

$$\text{Corr.} = + 0.115 \text{ mm.}; \text{M.F.} = \pm 0.020 \text{ mm.}$$

Die Correction des Reisebarometers ist also um + 0.05 mm. gestiegen. Ich habe mit den folgenden Correctionen gerechnet:

| | | | | | |
|--------------|---------------|----------------|----------------|--------------|----------------|
| Für Dalen | Juli 20.—22. | Corr. = + 0.07 | Für Balestrand | Aug. 18.—19. | Corr. = + 0.09 |
| „ Röldal | „ 24.—25. | “ + 0.07 | „ Leirdal | “ 23.—24. | “ + 0.10 |
| „ Ullensvang | „ 28.—30. | “ + 0.08 | „ Granheim | “ 26.—27. | “ + 0.10 |
| „ Bergen | August 5.—10. | “ + 0.09 | „ Tonsaasen | “ 28.—29. | “ + 0.11 |

Die Abwesenheit von Luft im Vacuum wurde überall durch Controlbeobachtungen bestätigt.

In Bezug auf die einzelnen Stationen verweisen wir auf die früheren Jahrbücher und folgende Bemerkungen.

Balestrand. Die Instrumente wurden am 31. Oktober 1886 von der früheren, etwas südlicher gelegenen, Station Flesje überführt. Die neue Station Balestrand befindet sich im Pfarrhof, Lunde genannt, am Sognefjord, zwischen den beiden Seitenfjorden Esefjord und Fjærlandsfjord. Die Höhe des Stationsbarometers Adie No. 1507 ist, nach meinem Nivellement, 14.8 Meter über dem Mittelwasser des Esefjords. Durch 8 Vergleichungen mit dem Reise-Control-Barometer fand ich am 18. und 19. August 1892 die Correction von Adie 1507 = + 0.115 mm., bei 759.8 (M. F. = \pm 0.015). Bei der letzten Inspection in Flesje, im Juli 1886, fand ich + 0.080 mm. Der Unterschied ist nur 0.035 mm.

Das Psychrometerhäuschen steht in einer gegen Norden wendenden Ecke, durch die Flügeln des Hauses sehr gut gegen die Sonne beschützt. Das Minimumthermometer wurde bei der Morgenbeobachtung abgelesen und eingestellt. Der Regenmesser steht im NW vom Hause, etwas höher als die Thermometer.

In den Uebersichtstabellen Seite 88 und 89 findet man für diese Station die beiden Bezeichnungen Flesje und Balestrand. Die letztere ist jetzt als die richtigere in der Zukunft zu benutzen.

Bergen. Durch 15 Vergleichungen fand ich am 5.—16. August 1892 die Correction des Stationsbarometers Adie No. 1564 = + 0.127 mm. (M. F. = \pm 0.021). Im Juli 1890 fand ich + 0.122, und im August 1886 + 0.136 mm.

Dalen. Durch 9 Vergleichungen fand ich am 20., 21. und 22. Juli 1892 die Correction des Stationsbarometers Adie No. 1478 = + 0.174 mm. (M. F. = \pm 0.044). Im Juli 1889 fand ich + 0.176 mm.

Granheim. Durch 9 Vergleichungen am 27. August 1892 fand ich die Correction des Stationsbarometers Adie No. 1511 = + 0.094 mm. bei 712.8 mm. (M. F. = \pm 0.017). Am Institut wurde im März 1876 + 0.06 mm. gefunden. Die Kew-Correction ist + 0.10. Im Juli 1886 fand ich bei der Inspection + 0.21. Da das neue Reise-Control-Barometer sich offenbar zuverlässiger gezeigt hat als das ältere, ist es nicht unwahrscheinlich, dass die in 1876 und in 1892 gefundene Correction durch alle Jahre die richtige gewesen ist. In den Uebersichtstabellen Seite 76 sind die Beobachtungen mit der Correction + 0.21 gegeben. Also wahrscheinlich um 0.1 mm. zu hoch.

Bei der Inspection hatte ich Gelegenheit, die Meereshöhe des Barometers genau zu bestimmen. Vor einigen Jahren ist ein Präcisionsnivelllement durch das Valdersthal geführt worden. In der Abstand von einem knappen Kilometer von Granheim ist eine Höhenmarke auf der Mauer der Kirche Vestre Slidre angebracht, in der Höhe von 393.09 Meter über dem Mittelwasser bei Christiania. Drei Nivellementsreihen gaben mir das Barometer (Kapsel) zu Granheim um 6.76 m. (M. F. = \pm 0.07 m.) höher als die Marke, oder das Barometer 399.85 Meter über dem Meere. Früher war die angenommene Höhe 394.7 Meter, also am 5.15 m. zu niedrig.

Koutokeino. Das Dorf liegt am Alten-Flusse im Inneren von Finmarken. Der Beobachter, Hrr. Lensmann Guldahl, nahm in 1882—83 an den Beobachtungen der norwegischen Polar-Station in Bossekop Theil. Die Station befindet sich im und am Lensmannsgebäude. Die Seehöhe der Station ist wenig sicher.

Jerkin. Die Station liegt auf dem Dovrefjeld, auf der nordlichen Seite einer von W nach E streichenden Thales. Die Thermometer haben einen sehr guten, durch die Terrainverhältnisse von der Sonne geschützten Platz an einer gerade gen Norden wendenden Hauswand. In derselben Richtung weiter vom Hause steht der Regen- und Schneemesser. Aus 5 Barometerbeobachtungen mit Fuess No. 270 am 23., 24. und 25. Juni 1891 verglichen mit den entspre-

chenden Beobachtungen von Dovre und Tönset berechne ich die Meereshöhe der Thermometer zu Jerkin zu 958.7 Metern ± 0.35 m. Die offiziellen Karten geben, für den Boden, 957 Meter.

Leirdal. Bei der Inspection am 23. August 1892 fand ich, dass das Thermometer am Stationsbarometer, Adie No. 1509, seit meinem letzten Besuche in 1886 eine Änderung erlitten hatte. Am Institute, in 1876, zeigte das Thermometer übereinstimmend mit den Thermometern der anderen Barometer. Als das Barometer im Sommer desselben Jahres in Leirdal aufgehängt war, zeigte das Thermometer etwa 3° tiefer als andere Thermometer, und es wurde eine neue entsprechende Scala angebracht und für die Beobachtungen und Berechnungen benutzt. In 1876 wurde am Institut die Correction des Barometers, mit der ursprünglichen Thermometerscala, zu $+ 0.47$ mm. gefunden. Bei der Inspection im Juli 1886 fand ich $+ 0.467$ mm. mit der neuen Thermometerscala. Bei der Inspection im 23. und 24. August 1892 fand ich, aus 14 Vergleichungen, die Correction von Adie 1509

$$\begin{array}{ll} \text{mit der ursprünglichen Thermometerscala} & + 0.455 \text{ mm. (M. F. } = \pm 0.025) \\ \text{„ „ neuen} & - „ - + 0.795 \text{ mm.} \end{array}$$

Vergleichungen mit dem Normalthermometer zeigten, dass die „neue“ Scala die Temperatur des Barometers jetzt um etwa 3° zu hoch angab, dagegen die ursprüngliche Scala wieder richtig zeigte. Die Correction des Barometers, mit der letzten berechnet, ist auch ganz übereinstimmend mit denjenigen, welche in 1876 und 1886 gefunden worden sind. In derselben Ecke des Zimmers, wo das Quecksilberbarometer hängt, ist auch, etwas höher, ein Aneroidbarometer mit Thermometer angebracht. Jeden Morgen um 8 Uhr werden beide Barometer mit ihren Thermometern abgelesen. Aus der Zusammenstellung dieser beiden simultanen Thermometerbeobachtungen konnte ich nun ganz sicher nachweisen, dass die Änderung des Thermometers am Quecksilberbarometer mit März 1889 anfängt und mit September desselben Jahres abgeschlossen ist. Der Betrag der relativen totalen Änderung ist $2^{\circ}.3$. Um die in den früheren Jahrbüchern für Leirdal gedruckten Barometerhöhen auf das korrigierte Thermometer zu reduzieren, erhalten wir demnach die folgenden Correctionen:

| | | | |
|------------|--------------|------------|--------------|
| 1889. März | $+ 0.04$ mm. | 1889. Juni | $+ 0.19$ mm. |
| — April | $+ 0.09$ mm. | — Juli | $+ 0.24$ mm. |
| — Mai | $+ 0.14$ mm. | — August | $+ 0.29$ mm. |

und später vom September 1889 bis Ende 1890, die Correction $+ 0.34$ mm. Im Jahrbuch für 1891 sind die Barometerhöhen richtig angegeben.

Lillehammer. Die Stadt liegt auf einer Anhöhe am nördlichen Ende des Sees Mjösen. Die Station ist im Telegraphenbureau. Das Stationsbarometer ist Adie No. 1483, dessen Kew-Correction nahe 0.0 mm. ist. Am Institute fand ich im Juni 1891 die Correction, bei 754.5 mm. gleich $+ 0.045$ mm. In Lillehammer fand ich durch 7 Vergleichungen am 18. Juni 1891 die Correction $= + 0.08$ (M. F. $= \pm 0.073$) bei 745.5 mm. Die Bedingungen waren nicht günstig für gute Vergleichungen, und ich habe daher die Correction gleich $+ 0.02$ mm. gesetzt, was mit der Kew-Correction und der in Christiania gefunden um ± 0.02 mm. übereinstimmt.

Die Seehöhe des Barometers ist vom Eisenbahnbauingenieur Fougner zu 190.05 Metern durch genaues Nivellement gefunden worden.

Die Station hat zwei Thermometergehäuse, das eine gegen EzN, das andere, mit dem Minimumthermometer, gegen WzS. Als Windfahne dient ein Wimpel auf einer hohen Stange. Der Regenmesser und Schneemesser stehen in dem Garten.

Listad. Die Station liegt im Gudbrandsdal, an einer Stelle, wo das Thal sehr breit ist, und am östlichen Abhang ziemlich hoch über dem Flusse.

VIII

Das Stationsbarometer ist Adie No. 1486. Am Institut wurde im Juni 1891 die Correction gleich —0.036 mm. gefunden, bei 754.6, bei welchem Stand die Kew-Correction —0.10 ist. Zu Listad fand ich am 20. Juni 1891 durch 7 Vergleichungen die Correction + 0.05 mm. (M. F. = \pm 0.039) bei 744.5 mm. Die Kew-Correction ist —0.05 mm. Die Beobachtungen sind mit den mit der Barometerhöhe etwas veränderlichen Kew-Correctionen berechnet worden, nachdem diese auf die am Institut gefundene Correction reduziert worden sind.

Es war schwierig, auf Listad einen bequemen Platz für die Thermometer zu finden, wo sie von der Morgensonne beschirmt werden könnten. Sie stehen an der Hauswand, an der nordwestlichen Ecke, unter dem Ueberdache eines an allen drei Aussenseiten offenen nach NE wendenden Altans im zweiten Stockwerk. Um die Wirkung der Sonne unschädlich zu machen, müssen die Morgenbeobachtungen um 9 Uhr genommen werden.

Aus correspondierenden Barometerbeobachtungen auf Listad und den Stationen Dovre, Tönset, Granheim, Hamar und Rena fand ich die Seehöhe des Listad-Barometers zu 275.9 Metern. Später hat die Eisenbahnbaubehörde die Gefälligkeit gehabt, dieselbe Höhe durch genaues Nivellement zu bestimmen und fand die Höhe 276.8 Meter über dem Mittelwasser bei Christiania.

Ein Wimpel auf einer Stange dient als Windmesser. Der Regenmesser und der Schneemesser stehen im Garten.

Nordörne ist 2 mal aufgeführt, als Temperaturstation und als Regenmesserstation.

Röldal. Von hohen Bergen eingeschlossen, ist diese einsame Gegend an den Ufern eines etwa 400 Meter über dem Meere liegenden Sees gelegen. Die Station liegt an der Landstrasse unweit des oberen, östlichen Ende des Sees etwa dreizig Meter über diesem. Die Thermometer stehen in ihrem Häuschen ausserhalb der nordwestlichen Wand des Hauses, durch dieses und gegenüber liegenden Anhöhen und Bergen gegen die Sonne gut beschirmt. Auf derselben Seite des Hauses, weiter von diesem, steht der Regen- und Schneemesser.

Durch 2 Beobachtungen am 24. Juli 8 p. m. und am 25. Juli 8 a. m. 1892 mit dem Barometer Fuess No. 270 und correspondierende Beobachtungen in Skudenes, Ullensvang und Dalen fand ich die Seehöhe der Thermometer in Röldal resp. zu 430.6 m. und 429.2 m., im Mittel 429.9 Metern. Früher wurde die Höhe zu 408 Metern angenommen.

Tonsaasen. Durch 7 Vergleichungen fand ich am 29. August 1892 die Correction des Stationsbarometers Adie No. 1506 gleich + 0.451 mm. (M. F. = \pm 0.027) bei 692.7 mm. Bei der letzten Inspection im Juli 1886 fand ich + 0.22, mit welcher die im Jahrbuch für 1891 gedruckten Beobachtungen reduziert worden sind. Am 15. August 1887 wurde die Station nach ihrem jetzigen Local, dem Telegraphenbureau, überführt. Es ist fraglich ob die Aenderung der Correction allmählig eingetreten sei oder bei der Ueberführung statt gefunden habe. Jedenfalls dürfen die in diesem Jahrbuche gedruckten Barometerhöhen für 1891 um + 0.2 mm. erhöht werden.

Der Höhenunterschied zwischen dem früheren und dem jetzigen Niveau des Barometers fand ich durch Nivellement gleich 5.87 Meter. Die frühere Seehöhe (Jahrbuch für 1887 S. VII, 620.9 m.) habe ich mit der genaueren Seehöhe von Granheim neu berechnet und 622.4 Meter gefunden. Hieraus ergiebt sich die jetzige Seehöhe des Barometers zu 628.3 Metern. Eine Berechnung nach den zwölf Monaten Juli 1891 bis Juni 1892 mit Granheim, Hamar, Eidsvold, Lillehammer, Listad, Dalen und Ullensvang als correspondierenden Stationen, und allen bekannten Correctionen mitgenommen, nach Perntner's Tabellen ausgeführt, gab mir eine Seehöhe von 627.9 Metern. Hoffentlich wird die Höhe bald durch Nivellement bestimmt werden können. Einstweilen nehme ich die Höhe von 628.0 Metern als die wahrscheinlichste an. In den Uebersichtstabellen S. 77 steht fehlerhaft die Höhe zu 630^m.8 angegeben. Diese Zahl gründet sich auf eine vorläufige Rechnung.

IX

Die Thermometer stehen in ihrem Häuschen auf der Nordseite des Gebäudes, sehr gut beschirmt.

Der Regen- und Schneemesser steht auf einem freien Platze im Nordosten von dem Hause.

Vang. Die Station hat zwei Thermometergehäuse, von denen immer eins im Schatten ist. Der Regen- und Schneemesser hat eine gute Aufstellung. Die Station liegt am südlichen Ufer des Sees Vangsmjösen.

Voss. Die Beobachtungen für April fehlen.

Ullensvang. Bei der Inspection am 28., 29. und 30. Juli 1892 fand ich durch 14 Vergleichungen die Correction des Stationsbarometers Adie No. 1563 gleich $+ 0.060$ mm. (M. F. $= \pm 0.043$). Bei der Inspection im August 1886 fand ich die Correction $+ 0.438$ mm.

Früher sind für Adie No. 1563 die folgenden Correctionen gefunden worden:

| | | | | |
|-------|----------------|-------------|-------------------|-----|
| 1877. | April. | Am Institut | Corr. $= + 0.046$ | mm. |
| 1880. | Juli. | " " | " $+ 0.141$ | |
| — | Septbr. | " " | " $+ 0.086$ | |
| — | " in Bergen | " | " $+ 0.040$ | |
| — | " - Ullensvang | " | " $+ 0.060$ | |

Das Barometer ist also auf die frühere Correction zurückgekommen. Es ist fraglich, ob die in 1886 gefundene Correction richtig sei. Die Umstände waren ungünstig, stetiges Regenwetter, und das Reise-Normalbarometer hat sich später bei einigen Gelegenheiten als unzuverlässig gezeigt. Jedensfalls ist die Correction $+ 0.06$ für 1891 die wahrscheinlichste, und die Seite 86 gedruckten Luftdruckswerthe sind mit dieser berechnet.

Die Tabelle auf Seite IX und X gibt eine Uebersicht über die Art und Lage der Stationen, die Höhe der Instrumente, die constante Correction der Barometer, die Schwerecorrection, die Beobachtungszeiten und die verschiedenen Beobachter. An den Telegraphenstationen ist ein bestimmter Beamter für die Beobachtungen verantwortlich. Auf den Leuchttürmen werden die Beobachtungen vom betreffenden Leuchtfuerverwalter ausgeführt.

In der ersten Rubrik „Ordnung“ bedeutet: I Station erster Ordnung,

II — zweiter —

III — dritter —

R Regenmesserstation.

Wegen der Controlle der Barometer- und Thermometerbeobachtungen siehe Jahrbuch für 1877, Vorwort Seite V.

Die Tabellen der ersten Abtheilung enthalten:

1. Den Monatstag.
2. Den Luftdruck oder die Barometerhöhe auf 0°C , auf das Normalbarometer und auf die Normalschwere reducirt.¹⁾ Die Reduction auf die Normalschwere nach der Formel

$$\text{Schwerecorrection} = b (-0.00259 \cos 2\varphi - 0.000000196 H)$$

wo b die auf 0° und das Normalbarometer reducierte Barometerhöhe, φ die Breite und H die Meereshöhe in Metern ist.

Auf jeder Druckseite ist der Betrag der Schwerecorrection angegeben; und zwar in der Weise, dass man unmittelbar sehen kann, mit welchem Zehntel des Millimeters man zu rechnen hat. Die nach der Schwerecorrection stehende Zahl ist der wahre Werth des Luftdrucks (red. auf die Normalschwere), bei welchem die Schwerecorrection, im Sinne unreduzierte minus reduzierte Barometerhöhe, eben von einem Zehntel zum nächsten überspringt. Es ist also ganz leicht, die Zahlen des Jahrbuchs für den Luftdruck, durch einfache Subtraction der angegebenen Schwerecorrection auf die uncorrigeerte Barometerhöhe zurückzuführen.

Die Luftdruckwerthe sind nicht auf das Meeresniveau reducirt.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

3. Die Lufttemperatur nach Celsius. Die Ablesungen sind durch Hinzufügung der Correctionen der Thermometer auf das Luftthermometer reducirt worden.²⁾ Die Ablesungen des Index des Minimumthermometers sind durch tägliche Vergleichung desselben, um 8 Uhr a. m., mit dem trocknen Thermometer corrigirt worden. Das Minimumthermometer wird um 8 Uhr p. m. eingestellt. Wo die Lufttemperatur in der Nacht, zwischen 8 Uhr p. m. und 8 Uhr a. m., kein Minimum nachweist, ist die Temperatur für 2 Uhr a. m. interpolirt und mit Cursiv gedruckt worden. Bei der unten beschriebenen Methode der Berechnung des Tagesmittels ist hierauf Rücksicht genommen.

Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

4. Den Dunstdruck in Millimetern aus den Psychrometerbeobachtungen nach Jelineks Tabellen berechnet. Die beobachteten Maxima und Minima sind mit fetten Typen gedruckt.

5. Die relative Feuchtigkeit auf dieselbe Weise berechnet. $00 = 100\%$.

Die Windrichtung rechtweisend nach 16 Strich in den englischen Bezeichnungen ausgedruckt.

6. Die Windstärke nach Schätzung; Scala 0 = Still bis 6 = Orkan³⁾.

7. Die Bewölkung nach der Scala 0 = Heiter bis 10 = Ueberzogen.

8. Die Höhe des Niederschlags in Millimetern, angeführt für den Tag, an welchem er gefallen ist. Der am Morgen gemessene Niederschlag ist also für den vorhergehenden Tag angeführt worden, ausgenommen in solchen Fällen, wo man mit Bestimmtheit weiß, dass er nach Mitternacht gefallen ist.

9. Bemerkungen über Niederschlag und andere Phänomene mit zugehöriger Tageszeit.

Die Bezeichnungen sind:

¹⁾ Wegen des Normal-Barometers siehe Jahrbuch für 1884, Vorwort, und auch Meteorologische Zeitschrift 1891, S. 252.

²⁾ Dies ist durch den glücklichen Umstand erreicht, dass die Correctionen des Normalthermometers auf das Luftthermometer weniger als $0^{\circ}.05$ betragen, nach Vergleichungen im April 1893 mit einem Thermometer von Tonnelot, welches am Bureau international des Poids et Mesures mit dem Stickstoffthermometer verglichen werden ist.

³⁾ Eine Vergleichung der geschätzten Windstärken mit gemessenen Windgeschwindigkeiten findet sich im Jahrbuche für 1874. Siehe auch Jahrbuch für 1875, Vorwort, Seite II., sowie Annalen der Hydrographie und Maritimen Meteorologie, 1889 S. 365—372, und Meteorologische Zeitschrift, 1890 S. 50—55.

Niederschlag oder andere Phänomene, die während eines der 3 festen Beobachtungsmomente wahrgenommen wurden, sind bezeichnet durch eine dem Zeichen des Phänomens nachgesetzte, die Beobachtungsstunde angebende, Ziffer: z. B. ● 1, Regen 8^h Morgens; * 3, Schnee 8^h Abends. Niederschlag oder andere Phänomene, die zwischen den festen Beobachtungszeiten beobachtet wurden, sind bezeichnet durch ein dem Zeichen des Phänomens als Exponent nachgesetztes n, a oder p.

Interpolierte Werthe sind mit Cursiv gedruckt.

Die Uebersichtstabellen der zweiten Abtheilung.

Monats- und Jahresresumé. Mittel und Summen.

Luftdruck, auf 0°, das Normalbarometer und die Normalschwere reduziert, nicht auf das Meeresniveau. Die Zahlen sind das Mittel von den drei täglichen Beobachtungen plus eine Correction. Diese Correctionen sind aus den vorhandenen stündlichen oder zweistündlichen Beobachtungen in Christiania, Christianssand, Bergen und Bossekop abgeleitet worden.¹⁾ Die Berechnungen sind mit zwei Decimalen durchgeführt worden. Die folgende Tabelle enthält die Correctionsgrössen, welche für 1891 angewendet worden sind.

Lufttemperatur. Von den Minimumtemperaturen gilt dasselbe wie oben in der ersten Abtheilung gesagt. Die Monatsmittel sind berechnet nach der Formel

$$m = n - k(n - \text{Min.})$$

wo n das einfache Mittel aus den drei täglichen Beobachtungen und k ein Factor ist, der mit der Station und dem Monate wechselt wie die Tabelle Seite XIV zeigt.

Die Werthe für k sind zuerst für Christiania, Bergen, Bossekop und Vardö nach stündlichen oder zweistündlichen Beobachtungen berechnet worden. Diese etwas ausgeglichen und dann in Karten für jeden Monat eingetragen, haben das Material gegeben, nach welchem Linien gleicher Werthe von k gezogen worden sind. Hierbei ist Rücksicht darauf genommen, dass solche klimatische Linien die Neigung haben, der Richtung der Küste zu folgen.²⁾

Für ein Land mit der Lage Norwegens muss diese Methode mit dem Faktor k der Methode mit festen monatlichen Additions-correctionen vorgezogen werden. Es kann freilich mitgegeben werden, dass die letzte Methode für den südlichsten Theil des Landes eben so gut wäre als die erste, und dass sie gewisse sowohl praktische als theoretische Vortheile hat. Für Christiania hat eine Berechnung gezeigt, dass die Methode mit k durchschnittlich bessere Ueberein-

¹⁾ Näheres hierüber in der Meteorologischen Zeitschrift f. 1891, S. 251, 252.

²⁾ Siehe auch Met. Zeitschr. 1891 S. 253 ffg. Es hat sich später gezeigt, dass die stündlichen Beobachtungen in Trondhjem zu schlecht waren, um für Bildung von Normalwerthe gültig zu sein.

stimmung mit den aus 24 stündlichen Beobachtungen hervorgehenden Monatsmittel zeigt als die Methode mit festen Correctionen; der Unterschied ist aber gering. Allein für das nördliche Norwegen, wo in den Wintermonaten in der Dunkelzeit die tägliche Periode der Lufttemperatur verschwindet, hat es, wenigstens für diese Zeit, keinen Sinn, das einfache Mittel aus Minimum und den drei festen Beobachtungsterminen zu nehmen und dieses Mittel durch Addition einer constanten Correction zu verbessern. Denn jede der drei Beobachtungen an den festen Terminen giebt einen Werth für das Tagesmittel von demselben Gewicht, die Minimumtemperatur aber liegt immer unter dem Tagesmittel. Nimmt man das einfache Mittel aus den drei Terminbeobachtungen, erhält man unmittelbar den möglichst genauen Wert für das Tagesmittel. Oder in diesem Fall hat man $k = 0$. Nimmt man dagegen das einfache Mittel aus den Terminbeobachtungen und dem Minimum, und fügt dazu eine Correction, so wird die richtige Correction für jeden Fall abhängig sowohl von der Minimumtemperatur als von den Terminbeobachtungen, aber ihre Hinzufügung kann kein besseres Resultat geben als das einfache Mittel der drei Terminbeobachtungen, wenn mehrere solche nicht vorliegen. Ihre Anwendung wird im besten Falle, wenn sie für den speciellen Fall angepasst ist, ein unnöthiger Umweg. Rechnet man, wie die Praxis gewöhnlich ist, mit einer festen Correction für jeden Monat, ist die Wahrscheinlichkeit, dass dies für den vorliegenden Fall genau passt, eine äusserst geringe, und ausser einen Umweg zu machen, begeht man einen Fehler.

*Für das nördliche Norwegen empfiehlt sich also die Methode mit dem Factor k , für das südliche Norwegen ist sie eben so gut wie diejenige mit festen Correctionen. Die Rücksicht auf die

Temperatur-Factor *k.*

Einheitlichkeit der Reductionsmethode für das ganze Land muss dann für die Wahl massgebend sein.

Für Christiania, Aas, Bjelland und Trondhjem sind die mittelst Maximumthermometer beobachteten absolut höchsten Temperaturen in jedem Monat mit zugehörigem Datum aufgeführt. Sonst sind es die auf die Beobachtungsstunden fallenden Maxima, und die mittelst Minimumthermometer gefundenen Minimumtemperaturen, welche aufgeführt worden sind.

Die Monatsmittel der absoluten Feuchtigkeit. Die Zahlen sind das einfache Mittel der drei Terminbeobachtungen plus eine Correction. Die Werthe dieser Correctionen stehen in der folgenden Tabelle. Sie sind aus den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.¹⁾ Für Röros, Tönset, Jerkin, Dovre und Tonsaasen ist Correction wegen des Luftdrucks an die Mittel der absoluten und relativen Feuchtigkeit angebracht worden.

¹⁾ Siehe Met. Zeitschr. f. 1891 S. 258.

Die Monatsmittel der relativen Feuchtigkeit. Diese sind nach der Köppen'schen Formel:

$$m = q + c(2p - q), \quad q = \frac{1}{2}(\text{Morgenbeob.} + \text{Abendbeob.})$$

berechnet worden.¹⁾ Die folgende Tabelle enthält die Werthe von dem Factor c . Sie sind nach den stündlichen Beobachtungen in Christiania, Bergen und Bossekop berechnet worden.

Die Monatsmittel der Bewölkung sind die Mittel aus den drei täglichen Beobachtungen.

Der Niederschlag ist die Monatssumme.

Die Zahl der Tage mit Niederschlag u. s. w. Die drei ersten Rubriken geben die Zahl der Tagen mit merklichem Niederschlag, mit Niederschlag über oder gleich 0.1 mm. und mit über oder gleich 1.0 mm. Tage, wo Schnee und Regen gemischt waren, sind als Schneetage gerechnet. Heitere Tage sind solche, wo die Summe der Bewölkung für alle drei Beobachtungsstunden weniger als 6 beträgt. Trübe Tage sind solche, an denen die Summe grösser ist als 24. Sturmtage sind solche, an welchen die Windstärke über 4 notirt ist.

Die Nordlichtbeobachtungen sind im Ganzen ziemlich unvollständig, so dass die in den Tabellen angegebene Zahl der Tage mit Nordlicht in der Regel bei weitem nicht die volle Anzahl ergiebt.

Die Windvertheilung ist direct aus den notirten Beobachtungen abgeleitet.

Das Monatsmittel der Windstärke ist das Mittel aus den drei täglichen Beobachtungen.

Bei den Leuchtturmstationen ist die Meerestemperatur das Monatsmittel für die Beobachtungsstunde 8 Uhr Morgens.

Sonst gelten für die Uebersichtstabellen dieselbe Bemerkungen wie für den ersten Theil.

Als Anhang folgen Beobachtungen über die Bewegung der Cirruswolken.

Die Liste über Druckfehler und Verbesserungen, welche nach dem Titelblatte folgt, corrigiert eine Reihe von Rechenfehlern, welche durch eine neue Berechnung von Normal-Mitteltemperaturen aufgefunden worden sind.

Die Berechnungen für das Jahrbuch haben die Herren Assistenten A. Steen, C. Kraft, N. J. Nielsen, Aa. Graarud und H. Chr. Löcken ausgeführt.

Christiania, Mai 1893.

H. Mohn.

METEOROLOGISCHE BEOBACHTUNGEN

AN

ZWÖLF STATIONEN IN NORWEGEN

1891

**In diesem Jahrbuch sind sämtliche Barometerhöhen auf die Normalschwere
reduziert worden.**

Höhe über dem Meere: 643.^m2

Breite: 62° 5'

Schwerecorrection: 0.^{mm}95, bei 715.^{mm}1

Januar.

Länge E. Greenwich: 9° 7'
